

## Exercise 11 – Set ActionMode Verify & Run Your TestCase

### Objective

By the end of this exercise, you will be able to verify values generated in the SUT and run a Tosca TestCase in the ScratchBook.

### Why is this important?

In automated testing, it is important to check that the correct values are generated. The main goal in this TestCase is to verify that the shipping costs according to your order are calculated accurately.

Additionally, the ScratchBook is where you can run and test individual steps or portions of your tests and see the results before final execution. This allows you to debug the tests before you deploy them. The results of the test are available temporarily.

### Key elements

Run in  
ScratchBook

### Instructions

1. Duplicate TestCaseFolder "Exercise 10 - ActionMode WaitOn" and name it "Exercise 11 - ActionMode Verify and Run Your TestCase".
2. Navigate to the TestStep **Process >> Verification of Prices >> Verification of Prices**.
3. In the **Cart Total** table, verify that the shipping cost (when **Ground** is selected as a delivery method) is **10.00**. The **Shipping Costs** are in **column 2 (<Col>)** and the Shipping Costs cell will be in the drop down list called **Shipping: (Ground)**.
4. Navigate to the TestStep **Process >> Verification of Success >> Verify the Order Success**.
5. Verify that the **Message Order Successful** is Visible.  
\*Remember: use the blue downward arrow to select: **Visible == True**
6. Run the TestCase in the **ScratchBook**.
7. Save your work.

### Cheat Sheet

Term	Description	Example
ScratchBook	<p>The ScratchBook is a Tosca built-in capability that allows you to perform trial runs of your TestSteps and TestCases.</p> <p>Such trial runs create only a temporary result. This temporary result is not saved and will be overwritten once you'll run a new TestCase or TestStep in the ScratchBook.</p>
